

September 17, 2012

I was diagnosed with Multiple Myeloma in August of 2009. Multiple myeloma is a cancer of the bone marrow that arises when plasma cells become malignant, invade the marrow, multiply uncontrollably, and disrupt normal bone function ([www.mskcc.org](http://www.mskcc.org)). At the time of diagnosis, I had surgery to remove some of the tumor in the sacrum of the spine and then underwent radiation to stabilize the cancer. I have an MRI done every 6 months to check the status of my condition. From completion of my radiation up until 2011 the MRI showed that the mass was still present but not active, therefore placing me in remission. In early 2012, my daughter recommended that I get treated at BodyCures to further improve my health. Several months later, in July 2012, I had a PET Scan done from head to toe. I was delighted to hear that the cancer has not spread and that the results showed **marked improvement** in the mass. This is the first time in the past 3 years that any MRI or PET Scan has stated any kind of improvement. I feel strongly that BodyCures' recommendation of proper supplements and nutrition has helped me achieve these results. I look forward to continuing my treatment and improving my health with BodyCures!

Sincerely,

Sebastian L
